

SDK and API Keys

This page hosts the keys that you'll need to setup the SDK, validate the JWT, and generate tokens for API usage.

To access this page, navigate to the [developer](#) page in your dashboard.

Environment ID

The environment ID is the key used for our platform to identify your SDK and associate the users to your project environment. Each project has 2 keys, one for Sandbox and one for Live. Whenever you want to setup a new instance of the SDK, you simply need to copy the Environment ID and copy it into the settings prop in the SDK.

```
TypeScript import { DynamicContextProvider, DynamicWidget, } from "@dynamic-labs/sdk-react-core" ; const App = ( ) => (
< DynamicContextProvider settings= { { environmentId: "Enter your Environment ID here" , } }

```

```
< DynamicWidget/

```

```
< / DynamicContextProvider> ) ; export default App;

```

Public Key

The public key is what you can use to validate the JWT is authentic on your backend. We recommend that you follow [this guide](#) to properly validate your users and ensure that users are using authenticated JWT's.

API Tokens

To use our API's, all you'll need to do is create a token and use it in your API requests as a bearer Token. You can test out our API's [here](#) .
