

I am providing oracle results to my own smart contract...

What is the best way to pay minimum gas?

Say for example I needed a number between 00 and 99...

Could I have 100 ethereum address' relating to those number... That interact with the chain when I want to provide each number?

Or by doing something like:

Staking/unstaking dai to receive interest while also paying for the gas for the oracle...

Let's get creative
