

TLS communication

EthSigner supports TLS to secure inbound and outbound HTTP JSON-RPC requests, and communication with HashiCorp Vault.

Private keys and certificates for client and server TLS connections must be stored in password-protected PKCS #12 keystores. The [server \(in this example, Hyperledger Besu\) must be configured](#) to accept TLS connections.

Use the command line options to configure TLS on [HTTP JSON-RPC requests](#) and [HashiCorp Vault](#) . [Edit this page](#) Last updated on Mar 30, 2023 by Eric Lin [Previous Overview Next Tutorials](#)
