

# Rust Client for Solana

Solana's Rust crates are [published to crates.io](#) and can be found [on docs.rs with the "solana-" prefix](#) .

Some important crates:

- [solana-program](#)
- — Imported by programs running on Solana, compiled to
- SBF. This crate contains many fundamental data types and is re-exported from [solana-sdk](#)
- , which cannot be imported from a Solana program.
- [solana-sdk](#)
- — The basic off-chain SDK, it re-exports [solana-program](#)
- and adds more APIs on top of that. Most Solana programs
- that do not run on-chain will import this.
- [solana-client](#)
- — For interacting with a Solana node via the [JSON RPC API](#)
- .
- [solana-cli-config](#)
- — Loading and saving the Solana CLI configuration
- file.
- [solana-clap-utils](#)
- — Routines for setting up a CLI, using [clap](#)
- ,
- as used by the main Solana CLI. Includes functions for loading all types of
- signers supported by the CLI.
