

It's currently a problem that we do not have more relays, especially from organizations in differing geographies. But as it stands relays are not cheap and there is no incentive to run one unless you're also a builder.

Could we:

1. Crowdfund and create grants for new relays? Could also work with all current relays to open source knowledge on operation and infrastructure. It would seem in the best interest of validator pools to fund such grants.
2. Normalize relays taking profit? This would most likely require unilateral agreement on fees to charge as the most stable equilibrium is 0% right now.
3. Use relay enforced builder staking to generate yield.
4. Other ideas?
