

Hi all,

I am wanting to run for genesis. However I have a few questions...

Other than SGX enabled HW, are there any other requirements posted yet? Minimum RAM / Bandwidth / Minimum Uplink / IPTransit connectivity (1GBIT) etc?

Are there any infrastructure topologies that Enigma wants secret nodes to abide by at this stage? For example, 4x Seednodes with connectivity through wireguard back to Secretnode?

Could secretnodes be run in parallel? Running a primary and a secondary secretnode for failover purposes? (Exchanging PK to secondary after primary goes down).

In my opinion, a good Genesis candidate will not be one which is running in a home or residential environment, simply for redundancy reasons (power & lower SLA on ISP side for connectivity).

I will be running from a datacenter (haven't picked a location yet, depends on requirements). However Ideally I will be choosing something in North America.
