

I've seen lot of topics talking about Staking, how it was written... if it was clear enough and bla bla bla... but why is nothing tackling the tokenomics aspect of \$APE

Do you know that staking is the only way to "freeze" circulating supply and eventually generate a supply crisis of \$APE (number go up)?

Let's talk about tokenomics and leave staking for a while...

Right now there are 168 million \$APE in circulation (remember max cap of 1 billion)

150 million were allocated for BAYC/MAYC to claim, and according to this analysis [Dune Analytics](#) only 90% of apes have claimed as by today.

So of that 168M we have 135M claimed by apes+10M in hands of launch contributors (as stated by [apecoin.com](#) vesting schedule)

That brings us to 145M , what are or who is holding the 23M left ?
