

Yes, all of this has to be in service of eventually attracting more AUM for the underlying hedge fund which would lead to higher staking caps on our side, and help ensure the ultimate survival of the fund. It seems like that process can only be "fast-tracked" to a very limited extent, so just on-boarding as many data scientist users as fast as possible could well just be accelerating the process of making the tournament/signals less and less attractive, even to the best users. But maybe that makes the token go up & up & up. So then no one will care about the tournament and just want to hold the token? Then it does become kinda ponzi-ish. So many dynamics, hard to say what will actually happen.
