

Hi CoW Protocol community,

I'm currently writing an article about the benefits of various decentralized exchanges and wanted to seek clarification. I am specifically interested in the following section of the privacy policy:

- Log Data
- your wallet address;
- the Internet protocol address ("IP address"); and
- transaction id/ Hash.
- your wallet address;
- the Internet protocol address ("IP address"); and
- transaction id/ Hash.

Does this mean that CoW Protocol independently stores user wallet address and IP Address for each transaction submitted? If so, is this stored in a manner which can lead to user identification (i.e. IP and TX are associated)? Or is it simply referring to the RPC relayer.

Many thanks for your help.
