

Hey everyone!

After executing the following commands:

1. "\$ npm config set prefix ~/.npm"
2. "\$ export PATH=\"\$HOME/.npm/bin:\$PATH\" "

The command "\$ which discovery" does give the location of where discovery is located on my machine, if i understand that correctly at least, however whenever I restart my machine it no longer can find it and prohibits me from executing any discovery commands.

Does someone perhaps know what is going on here?
