

Hey, this is Pavan. I just created an open source project called Cryptogalaxy, by using which you can get any cryptocurrencies ticker and trade data from multiple exchanges through REST / websocket and save it into multiple storage systems.

Currently supported exchanges : FTX, Coinbase Pro, Binance, Bitfinex, HBTC.

Currently supported storages : Terminal Output, MySQL, Elastic Search.

GitHub link for the app : <https://github.com/milkywaybrain/cryptogalaxy>

All feedback welcome.
