

Hey there. I want to discuss anyways we can make GMX a less inflationary token and slowly but surely transform into a net deflationary token in the long-run. What if the esGMX allocations were converted to grants/airdrops/partnership or added to protocol liquidity, and instead we could buyback actual GMX tokens from the market using a small or medium proportion of the platform fees and burn the GMX bought. This is just an idea off the top of my head. Would like to hear any interesting ideas any of you might have.
