At the end of the last year, [we received a Uniswap Foundation grant](#) to build 4 proof of concept hooks for the new UniswapV4

☆☆ Hooks are like liquidity pool plugins that give special powers

☆☆

Liquidity pools usually offer just management of the liquidity, generating yield for LPs, and enabling trading. With hooks, these are not the limits anymore. Hooks can enable liquidity incentives, limit orders, streaming swaps, or anything connected to the liquidity pool. All can be built directly within Uniswap.

Our hooks are aimed at increasing profitability for liquidity providers. The majority of LPs is struggling with being profitable while providing liquidity unless they're heavily incentivized, but Hooks can change that.

On top of that, our yield farming strategies will benefit from these hooks when UniV4 launches.

What our hooks can do?

Locking Liquidity & Incentives Hook

This hook enables locking liquidity in the pool and rewards users for it

. The liquidity is deposited in a full range (V2-like pool) and the liquidity rewards can be in any token or NFT. This hook also lets LPs withdraw early for a fee that's distributed to other LPs.

Liquidity incentives will play a major role in attracting liquidity to V4 pools, and currently there are no options of adding own liquidity incentives outside of Merkl.

Why are incentives important

- + Attracting more users
- + Stable liquidity depth over time
- + Customizable rewards and distribution
- + Early unlocks possible for a fee
