

Install binaries

You can install and use GoQuorum and Tessera using Docker containers, building from source, or by downloading pre-built release binaries.

Release binaries

The pre-compiled release binaries for GoQuorum and Tessera can be downloaded from the following links:

- [Quorum](#)
- [Tessera](#)

Once downloaded, add the binaries to the PATH environment variable to make them easier to run.

Build from source

GoQuorum

note We recommend installing from official [containers](#) or [release binaries](#) rather than building from source. If you build from source, use Go version 1.15 or later. 1. Clone the repository and build the source: 2. git clone https://github.com/Consensys/quorum.git 3. cd quorum 4. make all 5. Binaries are placed in REPO_ROOT/build/bin 6. . Add that folder to the PATH 7. environment variable to make it easier to run, or copy those binaries to a folder already in PATH 10. , for example /usr/local/bin 11. . 12. info 13. An easy way to supplement PATH 14. is to add PATH=PATH:/path/to/repository/build/bin 15. to your ~/.bashrc 16. or ~/.bash_aliases 17. file. 18. Run the tests: 19. make test

Tessera

Follow the installation instructions on the Tessera project page [<https://github.com/Consensys/tessera>]. [Edit this page](#) Last updated on May 15, 2023 by Alexandra Tran Carrillo [Previous Overview](#) [Next Ansible](#)
