

# Web IDE

The rollup launchpad also contains a web IDE, which allows you to deploy and interact with smart contracts on your Flash Layer. Click the "IDE" tab on the left panel of the rollup launchpad.

The IDE includes a contract generator where you can generate contracts compatible with our AltLayer contract states rollup solution.

Once generated, you can open the contracts within the IDE to do any modifications.

Let's try and deploy this contract. On the left navigation panel, select "Deploy and run transactions", select your wallet and your contract to deploy and finally click on the "Deploy" button. Confirm the contract deployment transaction using your crypto wallet, such as Metamask. Ensure your wallet is connected to your Flash Layer network in the top right corner.

Congratulations, you have deployed your first contract onto your Flash Layer.[Previous](#) [Terminate Flash Layer](#) [Next-Toolings FlashGPT](#) Last modified 10mo ago
