

At the time of this post I did not realize the full extent of these changes, but it did break a model pipeline of mine, or lets say it “freezed” my model which is the reason why it took me a while to realize.

I am using the NumerAPI

python client from the numerapi

package, and I want to retrieve from a given model the daily (preliminary) scores (CORR, FNC, TC, etc) from a certain round, so basically the same information like on this page: [kayeffnumeraitor daily scores](#)

With the previous numerapi

package, this was possible via the function “daily_submission_performance”. Now that this function is non-existent, how is the preferred way of retrieving said information?
