

State

The ICQ module stores one [RegisteredQuery](#) per identifier. RegisteredQuery contains all the necessary info for the ICQ relay to perform a query on remote chain. `last_submitted_result_local_height`, `last_submitted_result_remote_height` are only used for KV-queries and are modified only when a relay publishes result for a query.

Results for interchain queries are stored as:

1. [QueryResult](#)
2. structure is stored under unique key containing identifier of RegisteredQuery
3. ; [Previous Client Next Events](#)
