

Are there any known issues with mev-boost-relay related to invalid signatures a la <https://collective.flashbots.net/t/impact-of-the-prysm-invalid-signature-bug-on-the-mev-boost-ecosystem-at-the-shapella-fork/1623>?

I have been running a builder on sepolia for quite some time but I consistently get a 400 status code with error message "invalid signature" when trying to submit a block to the relay.

Is there something I may have overlooked that can cause this error?
