

Hello,

I'm having an issue where Metamask seems to want to treat my xFOLD as USDC.

I've tried bridging USDC from ETH to other networks using both Wormhole, and Anyswap, and in both cases, when I click "approve USDC" on their UI, but when metamask pops up, instead of offering me to approve USDC, it asks me if I'm sure I want to give this app access to my xFOLD.

It's a little inconvenient because the only way around it is to swap into USDT, which involves a second expensive transaction on the ETH network.

Any advice would be appreciated

thanks!
