

In order to involve the community in DAO “governance” by voting, to reward the brave and flex the muscle of “Decentralized Finance”, a sketch of a proposal is outlined below:

Consider that X percentage of the 0.05% TX fee after the switching be distributed to original airdrop wallets as a subsequent airdrop, provided; “the wallets held/hold a balance of 300 UNI during/for some critically defined period of time (to be defined before the vote.)”

The purpose of this is to fix the issue that centralized whale LP miners dump UNI rewards and this causes an additional cascade sell-pressure feedback loop that causes wide-spread sell-off devastating to UNI price. So it would go some way to restore the originally intended tokenomics of decentralized supply.
