

What do you think of the model of buying back and burning with the usdc received as a transaction fee, not the current way of paying usdc to dydx holders?

I think the problem with dydx at the moment is that there is no attractive reason to hold the token.

Of course, receiving usdc as a fee can be a big reason to hold it, but it seems that there are more dydx sold on the market than the usdc received as a fee, so it is less attractive to hold the token.

You can see this by looking at the market value of dydx right now.

In order to increase the status of dydx, I think it is also important to increase the value of the token.

I think it is good in the long run that the more scarce and highly utilized tokens become, the more users want to get the token and the higher the trading volume. Like bnb.

DYDX should create a reason for holders to hold the token for the long term.

I think it is better to increase the value of the token itself through burn than to allocate usdc in the short term.

What do others think ?
