

As a secret contract developer, I was facing issues while using Enigmampc's containers like local testnet or secret-contract-optimizer. For the past few weeks, I was looking into this issue and find a solution. You can't run docker images of Amd64 architecture on Macbooks with M1 chips. For that, you've to create an Arm64 image using docker buildx. Anyhow, as of now, [secret-contract-optimizer](#) is workable with mac M1. While local testnet and other containers will be soon made available by the enigma team. Please test this container using Figment [tutorial](#) and let us know here if you find any issues. Container can be run as enigmampc/secret-contract-optimizer:test

.

There are some containers that will not run on Mac with M1 chips like secret-network-node because it uses Intel sgx and can only be run on machine with intel chips but if you find a way to run those containers through Virtualisation or emulation. Please share

Special thanks to Reuven and Cashmaney
