

Yes, I used ai to write this. I am lazy for writing. Get over it aha. I ask you to focus on the underlying concept. One key factor we are dropping the ball on is inclusivity. Interoperability is centralized in its bias as it currently stands and not as upgradeable or future proof as it could be. Im proposing a language that all systems could speak and would be very backwards and forwards compatible. Is this a research forum, or one for english lit?

Also, no I haven't devised the best way to approach the concept yet. Hence the not so concrete examples. The post is meant to get brains turning on the idea. Feedback Im looking for should be productive not trying to assign a grade to the quality of the post itself. I've been out of school for quite some time and have no interest in going back. If you find it drags on skip to the appendix.

thanks
