

Hi!

We're building a DeFi game and want to build it with V3 as our liquidity pool infrastructure.

We're planning to deploy to game on AVAX, but V3 isn't deployed there yet.

We noticed AVAX passed the temp check, with no on-chain vote yet.

We're wondering:

- How might we accelerate the deployment of V3 on AVAX?
- Can we deploy V3 as a service to the community?
- If it'll take time to get to AVAX, can we deploy a small deployment just so our game has LPs, and then migrate to the official V3 when it comes to AVAX?

Would love your support please to launch our game with V3 pools on AVAX soon.

Thank you!
