

Step #2

of <https://build.scrn.network/validators-and-full-nodes/join-validator-mainnet.html> recommends setting the minimum-gas-price parameter to 0.1 uscrn and says that “this is the main parameter that affects your ROI, so you should adjust it with time.”

I don't think I understand this. Would someone please explain how this parameter affects ROI, and why it should be adjusted over time? What would be the disadvantage of not setting the minimum-gas-price parameter, or setting it to zero?
