

Make transactions

EthSigner provides transaction signing and access to your keystore by implementing the following JSON-RPC methods:

- [eea_sendTransaction](#)
- [eth_accounts](#)
- [eth_sendTransaction](#)

The sender specified in [eea_sendTransaction](#) and [eth_sendTransaction](#) requires a signing key. Signing keys can be [stored externally or locally](#) .

note If using EthSigner with [GoQuorum](#) for public transactions (that is, using [eth_sendTransaction](#)), the nonce must be specified. [Edit this page](#) Last updated on Mar 30, 2023 by Eric Lin [Previous Use multiple signing keys](#) [Next Using EthSigner with Azure Key Vault](#)
