

Quadratic voting is a way of handling the governance voting process so that more power is given to the masses but at the same time rewarding highly interested individuals.

So far I think the type of voting that will be done here will be of the style "one token one vote". Right?

This kind of voting heavily rewards people with big wallets and might end up leaving most people (who probably don't own many tokens but make up for most of the users on the platform) alienated.

Has any of you have had any experience with quadratic voting? Do you guys think it would be possible to implement something on that line for the governance proposals?
