

Querying Overview

Querying a Namada chain is done using the client `namadac` .

This section details several common queries; see all available commands with `namadac --help` .

query-account

`namadac query-account --owner` Returns the `Threshold` and `Public` key(s) of an established account.

query-pgf

`namadac query-pgf` Returns the list of PGF Stewards, their reward distribution, and active PGF streaming payments.

query-proposal

`namadac query-proposal --proposal-id` Returns info on a given proposal, including its type, author, content, `StartEpoch`, `EndEpoch`, `GraceEpoch`, and `Status`.

query-proposal-result

`namadac query-proposal-result --proposal-id` Returns the outcome of a given proposal, including whether it's `Passed/Rejected`, the total number of votes for `yay/nay/abstain`, and the threshold (fraction) of the total voting power needed to tally.

query-proposal-votes

`namadac query-proposal-votes --proposal-id` Returns the results of all wallets that have voted `yay` or `nay` on the proposal

`namadac query-proposal-votes --proposal-id --voter` Returns the result of a specific wallet that has voted on a specific proposal
