

I'm trying to install ethdo, as the instructions say here <https://docs.eigenlayer.xyz/restaking-guides/restaking-user-guide/native-restaking/repointing-a-validators-withdrawal-credentials>

Here are the ethdo instructions: <https://github.com/wealdtech/ethdo?tab=readme-ov-file#docker>

When I get to this step `docker build -t ethdo .`

, my terminal returns the following:

```
Building 0.0s (2/2) FINISHED docker:desktop-linux => [internal] load build definition from Dockerfile 0.0s => => transferring
dockerfile: 2B 0.0s => [internal] load .dockerignore 0.0s => => transferring context: 2B 0.0s ERROR: failed to solve: failed to
read dockerfile: open /var/lib/docker/tmp/buildkit-mount2069960395/Dockerfile: no such file or directory
```

I'm not sure how to proceed from here.
