

# How to verify the multisig is a Gnosis one

Gnosis multisig contracts are usually deployed from the Gnosis factory contracts. Gnosis has the list of proxy\_factory contracts addresses deployed to different networks — <https://github.com/safe-global/safe-deployments/tree/main/src/assets>

## How to verify my multisig is deployed from Gnosis factory

1. Pick the contract version in gnosis UI (settings->safe details) — those usually are 1.0.0
2. , 1.1.1
3. , 1.2.0
4. or 1.3.0
5. .
6. Open the safe address in network explorer
7. Find the safe creation tx (should be the oldest one in "Internal Transactions" tab & have "Contract Creation" note)
8. Get the address the safe creation tx went to — should be a factory contract
9. Open the corresponding version's folder on github <https://github.com/safe-global/safe-deployments/tree/main/src/assets>
10. , open proxy\_factory.json
11. file & find the address in the list of deployed addresses [Edit this page](#) [Previous](#) [Checking the evm script from Aragon](#) [vote](#) [Next](#) [How to claim 1inch stETH/LDO pool rewards](#)
