

I keep getting an error message in Arbitrum-V3 when trying to make transactions or switch tokens:

“No matching key.”

What in the world is this? I'm trying to switch my funds from ETH->Arbitrum and this is stalling all my progress. I try new browsers, disconnecting/reconnecting, mobile, lowering amount, increasing slippage, etc and this keeps happening... I'm just trying to switch tokens and supply tokens, but this error always pops up.

Is Arbitrum just a more glitchier/touchier system to use than ETH? Am I missing something?
