

Hello everyone,

I hope this message finds you all well. I'm working on an MEV (Miner Extractable Value) arbitrage bot designed for the Arbitrum network in JavaScript. We're looking for insights and guidance on how to find the optimal input amount for our bot.

If anyone here has experience with Arbitrum or other networks with JavaScript or python and can offer assistance or suggestions, I'd greatly appreciate your input. Feel free to reply here or reach out to me directly.

Thank you in advance for your help, and we look forward to your contributions.

Best regards,

Sam Nassery
