

Got a NUC10 to test out the network, and have my full node running.

Then I got to the “Join as a Validator” section and saw the need for tokens.

This then got me reading up on how to procure SCRT / wallet / etc. Some questions:

Reading through: <https://secretnodes.org/#/tutorials/ledger-swap>

I have my ledger in dev mode and only have version 2.16.1 of the Cosmos(Atom) app available to me. Is this ok?

As for the actual interface - what are people using? Ledger live doesn't have the ability to work with SCRT. So I then pop'ed over to <https://puzzle.report/> signup/etc and log'ed in at present. It also seemed to be the 'next step' in the above process.

However, once in - I don't see any way to generate an address using my Ledger.

Now my NUC10 is running as a full node, and I have been able to generate an account (in fact it is:

secret1pc4za4w3z0pfgqxl3ary9zlhmf528uutv65ud). However, I was hoping to use the ledger.

I even went back to <https://secretnodes.org/#/tutorials/ledger-swap> and looked at the binaries listed; however, these give me “enigmacli” and I don't see the necessary subcommands to access the ledger. In fact, I don't think that this has anything at all to do with wallet functionality (could be off though).

Thanks in advance.

UPDATE: I visited <https://explorer.cashmaney.com/> and was able to get my ledger to work.
