

Hey Uniswap Ecosystem

I'm MAD from the Moonbeam ecosystem. Members of the Moonbeam ecosystem can sympathize with the position of the Gnosis Chain ([Continue the Uniswap V3 deployment on Gnosis Chain with different bridge provide](#)), and we support this proposal.

Much like Gnosis, the Uniswap community voted to approve a Moonbeam deployment ([Uniswap Interface](#)), but Moonbeam never received it after the events of the Nomad hack. Both communities are in limbo with an approved license but without a deployment. Since the hack, I've stayed extremely vocal about Uniswap coming to Moonbeam and would love to see it finally happen.

After seeing some of the recent posts as well as the expiration of the license on April 1st, I would like to suggest that Uniswap should consider the Moonbeam deployment simultaneously, given the shared circumstances. The Nomad hack impacted Moonbeam but has since regained steam and has collaborated closely with several bridges, including the Wormhole team, to provide a reliable bridging.

The Polkadot ecosystem continues to expand, and more new and innovative assets will continue to deploy within Polkadot. I believe that a Uni V3 deployment would get significant traction in the ecosystem and drive adoption for new Polkadot assets as well for the community.

Would there be the ability to take this forward with Wormhole (based on the synergies and seeing they're live with BNB) to get this finally deployed and show value for the Uniswap community and Moonbeam's ecosystem?
