

v1nc3n7:

That seems contradictory to the fact that with Signals, we have to bring our own data, and while such data can be of interest to Numerai, we cannot expect to have results as good as the ones we can get in the classic tournament that is using expensive financial data.

It is an apples to oranges comparison to the classic tournament due solely to the difference of the prediction windows. If Signals were extended to predicting returns a month out, then we could generalize to data quality statements. I doubt the classic tournament would have such positive results predicting 6 days out...

Otherwise, your payout suggestion is sensible to reward participation with lower percentages.
