

The success of the Avalanche V3 market showed some protocol inertia inefficiency.

USDC deposit cap has been reached in less than 10 days and the regular framework to increase it would be to post a governance thread for 5 days, then start a snapshot vote that start 24h after posting for a vote that last at least 3 days, then gather proposition power of 80k Aave then post an AIP for a vote that last at least 5 days.

Even with perfect sync and full community support, the full process would take a couple of weeks. In reality a month is more likely as a timeframe.

This inertia is good for protocol safety but it hurts protocol growth and attractiveness. I would suggest the community to consider adopting a fast-track process for V3 markets leveraging the current possible community enforcement capability on most V3 markets.

Suggested fast-track process :

1. Governance thread for 24h
2. Snapshot with immediate vote open for 48h
3. Community multisig enforcement

Suggested scope & limitations of the fast-track process :

-Fast-track can only act on Supply & Borrow caps with a 50% change

-Fast-track requires an 80k AAVE quorum

- YAE
- NAE
- ABSTAIN
