

Outside of participating in the governance. It is cool, but I cannot imagine risking money in a token that won't generate revenue in a way or another as the network grows.

Huge PS :

Please exclude law and governments, from the topic. Anyone can create a chain where they don't care having a token being considered as a security by this or that country and build a superior network : not choosing the best for a chain because of this goes directly against the principle of decentralization and permissionless. In that case one shall just build a faster/cheaper centralized network, as you never know what the law will be tomorrow. It is not a question I ask to lawyer/politician, but to economist/scientist/builders. Thank you.
