

In this research article, I define the necessary data types & algorithms needed to run the ethereum beacon chain light client as an 02-client IBC module.

This will allow IBC enabled chains to communicate trustlessly with the ethereum beacon chain.

## **ICS-15 ethereum beacon chain light client specification for IBC**

This technical specification assumes that you're already aware of the sync committee protocol introduced in the altair, the first hard fork of the ethereum beacon chain. If not, tl;dr: The original attestation protocol unfortunately did not include...
