

Hi, I spent the last few months studying areas such as Machine Learning and Distributed Computing.

I have used as a basis the book "Advances in Financial Machine Learning - Marcus Lopez" and worked on a model with the following results.

I would like your help for a correct interpretation:

Results:

R2

CORRS

Prediction X Assertiveness - Train\_On\_1 - Eval\_On\_2 (R2 = 0.142098)

Thank you very much in advance.
