

Here's a "problem":

I'm pretty sure that Uniswap's plan for V3 did not take into account the Binance chain.

As you probably know, [V3 is planned to release first on L1](#), and later to implement L2.

So it's not currently planned to be scalable from day 1.

Now the problem is that if V3 is really awesome, and they release it now, Binance will copy it.

Users will still be heavily limited by the cost of transaction on Ethereum, and if V3 is great (which I think it will be), users might decide to sacrifice decentralization in order to be able to afford to use it.

They'll end up on the Binance chain using "Pancakeswap V3", and Uniswap V3 could greatly benefit Binance instead of Ethereum (where most won't be able to afford to use it).

Thoughts?
