

Hi Everyone,

for reference, i'm a windows user and this is basically my first foray into Ubuntu and the CLI in general. I've followed the guide for setting up a secret node on my NUC. When attempting to deploy the node with "bash start.sh" i get the following output:

```
user@node:~$ bash start.sh
```

CD into Discovery-Docker-Network

Making sure discovery-docker-network is up to date.

WARNING: The DOCKER\_TAG variable is not set. Defaulting to a blank string.

WARNING: The SGX\_MODE variable is not set. Defaulting to a blank string.

WARNING: The COMPOSE\_PROJECT\_NAME variable is not set. Defaulting to a blank string.

ERROR: Couldn't connect to Docker daemon at http+docker://localhost - is it running?

If it's at a non-standard location, specify the URL with the DOCKER\_HOST environment variable.

Start 9 workers on your Secret Node. Note : 9 is the max amount of workers you can run.

Creating .env file from template

Running in Hardware Mode, as per SGX\_MODE=HW in .env file.

NODES is set to 9

Error: SGX driver not found. Run in simulation mode instead with:

```
./launch.bash -s
```

can anyone assist me to get up and running?

Thanks in advance!
