

I'm trying to run a non-validating dydx node on mainnet and I kept getting this error

validator set is empty after InitGenesis, please ensure at least one validator is initialized with a delegation greater than or equal to the DefaultPowerReduction ({824644215040})

According to the instructions, I should use a genesis.json that doesn't have any validator set, are there any guidelines on how to properly configure this?
