

title: [TEMP CHECK] Update Aave Snapshot Space

author: TokenLogic with support from Snapshot Team

created: 2023-08-07

Summary

This publication seeks to update the Aave Snapshot Admin, Author and Controller addresses.

Motivation

The current Snapshot configuration is outdated and require a refresh. Whilst refreshing the assigned roles, there is an opportunity to migrate the Snapshot Space to one controlled indirectly by the short_Executor.

A [brief recap of the roles](#):

Controller

- Controller of space has a full control over the space settings including managing the list of admins.

Admin

- Admin can edit space settings with the exception of the list of admin users and archive proposals.

Author

- Author can create proposals regardless of their voting power and the proposal validation strategy.

In summary, this publication seeks to achieve the following:

- Replace inactive admins with active contributors as admins
- Replace and update Authors
- Migrate the Snapshot Space to a Space where Short_Executor is indirectly the Controller via an intermediate contract

The current Admin list consists of mostly inactive contributors which creates a reliance of the remaining active contributor (ACI). Whilst ACI has been doing a great service to the DAO, this publication seeks to refresh the admin list to include active contributors. It would be ideal to have coverage spanning several time zones in providing robust coverage for the DAO.

With respect to the Author role, this role enables those with it to submit Snapshots for voting without needing to meet the minimum balance requirements. Outside of this benefit, there is no advantage to being an Author.

In recent history, there have been issues with Snapshot votes being posted that have not followed the governance process. As a result, the minimum balance requirements were increased. If several Authors are added, then the minimum balance can be increased further making it less likely that spam like posts will be generated. The current minimum balance requirement is 1.6K units of voting rights, which is equivalent to \$102,400 USD at \$64/AAVE.

Currently, the controller of the Aave Space is the aave.eth ENS address.

There exists two options granting varying levels of responsibility to the short_Executor.

- Delegate responsibility to the short_Executor
- Migrated to a new Aave space that is controlled by short_Executor

Delegating responsibility grants the functionality of being the Controller of the space. However, it can be removed anytime.

As the short_Executor is not EIP-1271 compatible, the space can not be migrated from aave.eth to the short_Executor. It is possible to deploy a new contract which is EIP-1271 that can host the Aave Space. This new contract would be controlled by the short_Executor.

Please do comment in the comment section below, as feedback will be incorporated into the publication.

Specification

The below table details the current Snapshot Admins
