

[MEV Relay Dashboard](#)

To collect the data, I've put together a simple monitor that queries the /data

API of each relay and pushes the resulting blocks data to Google BigQuery. You can query [the datastream](#) directly and build your own views and dashboards.

The relay datastream can be joined with the public [Ethereum BigQuery dataset](#) for deeper analytics on block content.

[Here's an example query](#) (see Details

tab).

[The monitor is also open source](#) and I've provided instructions on how you can run your own.
