Comment from Uma:

The question of what ZK scheme to support is inherently political and can get kind of tricky. There are a lot of different variations, even within families of similar protocols. For example with FRI-based protocols, different protocols use different hash functions for the merkelization and sometimes use different degree extensions.

I think groth16 (which Ethereum has), is probably the most universal one that maybe everyone can agree on (because of Ethereum), but again that is a choice to be made.
