I would like to ask a question about the Enigma protocol and our blockchain. 8 Months ago, we have started a project called Serey (<u>serey.io</u>) which focusses mainly on Cambodia. We have forked it from the Steem blockchain which is graphene.

Right now, I am a bit concerned with EOS, as at EOS you will be able to create more advanced DApps than the current graphene blockchains. We will then have a disadvantage to these DApps.

My question is, is it possible for a graphene blockchain to use Enigma as a second layer smart contract platform? So that our blockchain can also evolve into a more advanced platform?
