State

The ICQ module stores one Registered Query per identifier. Registered Query contains all the necessary info for the ICQ relayer to perform a query on remote chain.last_submitted_result_local_height ,last_submitted_result_remote_height are only used for KV-queries and are modified only when a relayer publishes result for a query.

Results for interchain queries are stored as:

- 1. QueryResult
- 2. structure is stored under unique key containing identifier of Registered Query
- 3. ; Previous Client Next Events
