Tracing

BlockScout supports tracing via Spandex . Each application has its own internally configured tracer.

To enable tracing, visit each application'sconfig/.ex and changedisabled?: true todisabled?: false . Do this for each application you'd like included in your trace data.

Currently, only Datadog is supported as a tracing backend, but more will be added soon.

DataDog

If you would like to use DataDog, after enablingSpandex , set"DATADOG_HOST" and "DATADOG_PORT" environment variables to the host/port that your Datadog agent is running on. For more information on Datadog and the Datadog agent, see the documentation .

Other

If you want to use a different backend, remove the Spandex Datadog. Api Server Supervisor. child_spec from Explorer. Application and follow any instructions provided in Spandex for setting up that backend.
