Bridge Tokens with Etherscan

How to bridge ERC-20 tokens from Ethereum and Polygon to Celo.

Approve the Bridge

Start by approving token usage on the bridge.

- Navigate to the Etherscan
- (or Polygonscan
-) page for the token you want to send
- · Open theWrite Contract
- · pane >connect your wallet
- and selectapprove
- Forspender
- enter the BridgeRouter address:
- Ethereum
- Polygon

Ethereum BridgeRouter Address =0x4fc16De11deAc71E8b2Db539d82d93BE4b486892 Polygon BridgeRouter Address =0x3a5846882C0d5F8B0FA4bB04dc90C013104d125d * Foramount * enter the number of tokens you'd like to send in that token's smallest unit.

tip If you're unsure, check the decimals in the Read Contract pane

- For most tokens the number of digits is 18
- The + button next will help you fill in the right number info Approving too much is usually ok, but not approving enough will cause your next transaction to fail.
- Selectwrite
- sign the transaction > then send it to the network.

Call the Bridge

You can now start sending tokens on the approved Bridge.

- Navigate to the appropriate page for the router
- 2. Ethereum
- 3. Polygon
- 4. Celo
- 5. Avalanche

 $\label{eq:address} $$ = $0x4fc16De11deAc71E8b2Db539d82d93BE4b486892$ Address $$ = $0x3a5846882C0d5F8B0FA4bB04dc90C013104d125d$ Address $$ = $0x1548cf5cf7dBd93f4dA11f45fCce315573d21B60$ Address $$ = $0xB6bB41B1fb8c381b002C405B8abB5D1De0C0abFE$ * Open theWrite as Proxy * pane > connect your wallet > and select send$

- For_token
- . , enter the address of the token you want to send
- For amount
- . , enter the amount of tokens you'd like to send in that token's smallest unit.

info This should be the same number you approved earlier. * For_destination *, enter the domain ID of the chain to which you'd like to send tokens.

- · On Celo
- On Polygon
- · On Ethereum
- On Avalanche

Celo Domain ID = 1667591279 Polygon Domain ID = 1886350457 Ethereum Domain ID = 6648936 Avalanche Domain ID = 1635148152 tip Domain IDs are like phone numbers. They represent the chain you're going to call. * For_recipient * , enter

the address of the recipient on the destination chain.* To help support future chains with longer addresses, Optics uses 32-byte addresses. * * To convert an Ethereum, Celo, or Polygon address to bytes32 you can add 24 0s after the 0x prefix

tip Before: bytes32 0x6a39909e805A3eaDd2b61fFf61147796ca6aBB47

Wait

Wait for a moment for your transaction to finalize on the network. <u>Edit this page Previous Bridge Native Assets with Etherscan Next Optics</u>
