Guide to being a signer at any Lido DAO multisigs

Lido DAO uses multisig wallet for different ops for flexibility and fast reaction times. Here's a list of general tips & rules around being the signer:

- 1. Use hardware wallet & back up the seed phrase.
- 2. Upon joining to any multisig make sure to verify the address according the guide
- 3
- 4. Check transactions you see on the multisig. If it's unclear to what the transaction should do and why don't sign it and ask for explanation.
- 5. Every transaction should have "how to check" guide.1. Addresses & sums in question should be verifiable through third party sources (message from your fellow multisig co-signer doesn't cut it).
- 6.
- 1. Technical checks, if those are required (i.e.for smart contract interaction), should rely on ready-made third party software and not custom scripts & UIs.
- 7. While requesting the signatures tell explicitly whether the transaction can be executed right away or would need to wait for something.
- 8. Communicate once you've checked and signed the transaction ("checked, signed, X more required").
- 9. If the transaction can be executed right away the last signer does it. If they can't do for any reason communicate it.
- 10. If you're executing already signed transaction make sure to check it as if you were signing it <u>Edit this page Previous</u>
